Project Goal and Objectives:

Motivation:

Have you ever dreamt of using a universal application, where you can avail a wide range of access over media? Have you ever hung up browsing for different applications to access different media? Well, if you feel yes to any of the questions posed above, then you are in the sweet spot. Medianizer is a collection of media such as Music, Videos, Photos and Books where users can rent or purchase media.

Significance:

As we see people end up using many applications, each for a specific kind of media. This is really burdensome and frustrating sometimes. So here comes Medianizer, where a plethora of media is brought onto a single platform, so that the customers are likely to fetch desired media in the blink of an eye.

Objectives:

Users can avail options like browsing, renting, purchasing and rating media. This application eases the browsing burden by making it much user friendly. Media can be previewed before purchasing or renting it. Users can register themselves by creating an account and can use the credentials like Username and Password to login to the application. There are online payment options available like Payment through Credit Card/ Debit Card, Paypal and many more(yet to be decided).

System Features:

Along with the features mentioned above, this application also notifies users, whenever a new stuff is added, through custom notifications. The search time is drastically reduced, than it usually

takes, with the help of Medianizer by enhancing the performance. This application is going to be developed in such a way that it is supported on both android and windows platforms.

Related Work:

Library Management System

Keeping track of records like students and book records, account details, managing employee all the time manually is very difficult. Students face many problems in library such as finding a book, availability of a book, time during which the book is available, searching of books using book code. So, to eliminate this manual system, library management system has been introduced. Library Management System helps in handling all the current issues faced by the students and by its admin personnel.

Backup Project:

T.A.S.K is a website which serves as an online parlor. This application assists users by showcasing all the services it provides along with the product details and the price information for each treatment. Customers are even allowed to book an appointment at their flexible time. Based on the service rendered by the staff, customers can provide both the feedback and rate the service. All the static information such as Opening hours and Contact Information are also rendered. By availing a service, customer can even perform an online payment using the website. This bridges the gap between the stakeholders.
